

Protecting
Your Data™

Data security and mobility on your terms

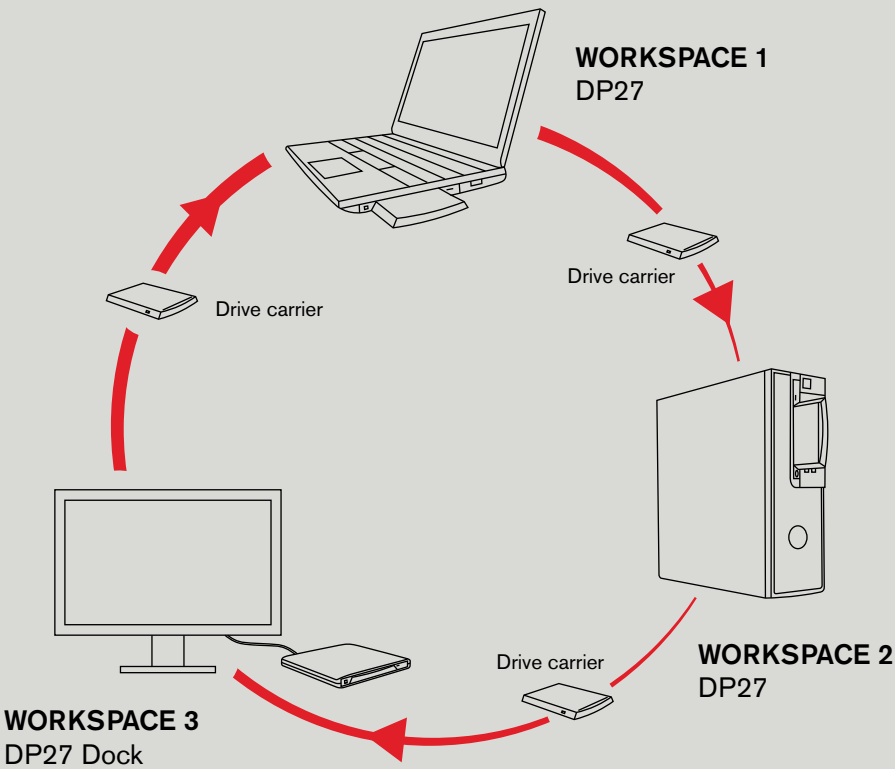

The DataPort DP27 removable drive is designed to fit into slimline optical disk drive bays, one of the most commonly found drive bays in computers today. That means that the DP27 can be installed into workstations, desktops, laptops, all-in-ones, government technology, or any other type of device. The DP27 ingests 2.5" hard drives or SSDs with the speedy 6G SATA interface.

Data when and where you want it

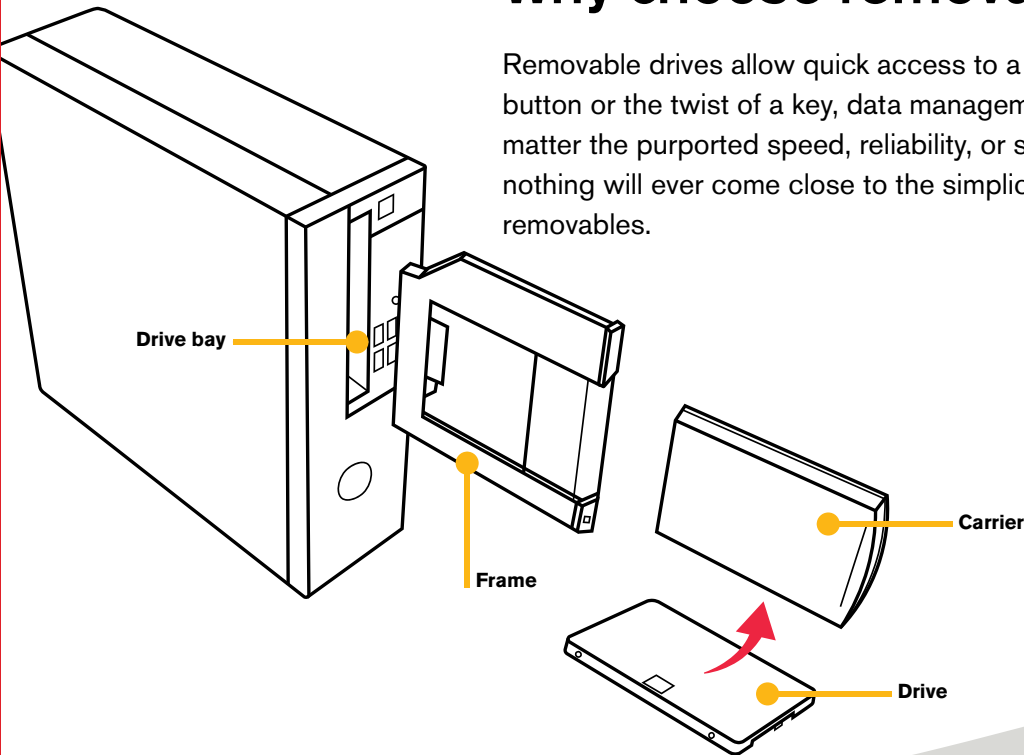

The DP27 comes in three forms: a lockable version, a push-button version, and an external direct-attach version that mimics a traditional external hard drive. Install any of these options into workstations, laptops, desktops, and easily swap drive carriers between them.

With the DP27, it's simple to remove the entire drive and OS environment and quickly launch it in another computer system.

Why choose removable drives?

Removable drives allow quick access to a computer's drive. With the push of a button or the twist of a key, data management is in your hands – literally. No matter the purported speed, reliability, or security of other storage solutions, nothing will ever come close to the simplicity and dependability of CRU removables.
